clinell™ | clean between

Clean between **each vaccine**

Contaminated surfaces and equipment contribute to the transmission of bacteria and viruses, which can potentially lead to infection. By keeping the main point of contact clean you can ultimately reduce the risk of infection for both staff, patients and residents when administering a vaccine.

Vital areas you should clean are both the entry and exit door handles, equipment at the vaccination site, such as chairs used by staff and patients/residents; and equipment situated nearby like waste bins and sharps disposal tubs. You must maintain a high standard of hand hygiene throughout the day. Cleaning hands before and after administering a vaccine will help to keep yourself and patients/residents safe from any microorganisms.

Cleaning saves lives.

The 5 principles of cleaning

1. Wipe in an ‘S-Shaped’ pattern
2. Work from top to bottom
3. Wipe from clean to dirty
4. Ensure correct contact time
5. One wipe, one surface
